

# **REPORT AGRICULTURE (HAND IN HAND UGANDA)**

**JULIUS KYEUNE**

**KEY FARMER TRAINER**

**MARCH 2010**

I greet you in the Name of Our LORD Jesus Christ

In this month we had our program as follows

1. soil conservation
2. Trainings in maize, beans, and ground nuts sweat potatoes
3. Trainings in pre harvesting
4. Banana management
5. Monitoring and evaluation

Our achievements

Soil conservation and soil fertility we had to continue with it by stable rising the contours l bridges and cut off drains and having different stales of adding nutrients in the soil i.e. making compost green manure and plant tea

Trainings on maize, beans and groundnuts and per harvesting I have just teach them verbally because learning and planting materials are not yet in place.

Banana trainings some of farmers have started planting new banana plantation so that they can practice what they learnt from us implementation and prove whether methods can work in their area

I had transplanted vegetable seedlings and we have already planted vegetable seedlings in our demonstration garden 120 seedlings and giving out enough seedlings that had already repaired his or her garden

## **THE SHOTCOMINGS DURING MY IMPLEMENTATION**

The problems are same which are in previous month February they are not yet solved in this month we had a big problem Fr.. Charles lost his father and God rest him in eternal peace; it affects very much the whole village

We have met a problem of increase in the cost of fuel which led to the increase commodities we need.

## **PROPOSED SOLUTIONS TO THE ABOVE LIMITATATIONS**

The possible solutions are shown in the report of February 2010

## **MONITORING AND EVALUATION**

I had an OBJECTIVE; to have high yield, qualitative products and optimum production

These are activities which gone half way

ploughing of our demonstration

Transplanting of seedlings

Methods of controlling pets and diseases in both vegetables gardens and new and old banana plantation

same farmers had already choose banana sites

planting banana plantations

Meeting

methods of improving soil fertility and

Soil conservation

Some small tips on coffee planting

These are some indicators which I managed to achieve in my effort

1. Sites of planted bananas
2. Records of both kft and same farmers
3. Vegetables which are planted in our demonstration garden
4. Nursery beds in place
5. The health of crops or free pests and diseases

Targets

I aimed 107 households but 69 of them managed to attend the seminars

**REMARK**

I had few people because , its time for planting crops and another problems I don't know and dilly of planting materials cause of having few farmers and had already had plans of hand in hand hence losing moral to come in seminars

I would like to stop here by saying that "thank very much for what you're doing to see weather people of Uganda at least make a step of develop"

**HAPPY EASTER EVERY BODY AND  
MAY GOD Bless YOU ALL IN GERMAMY**

.....
